

# Interoperability, critical element for an eHealth Strategy

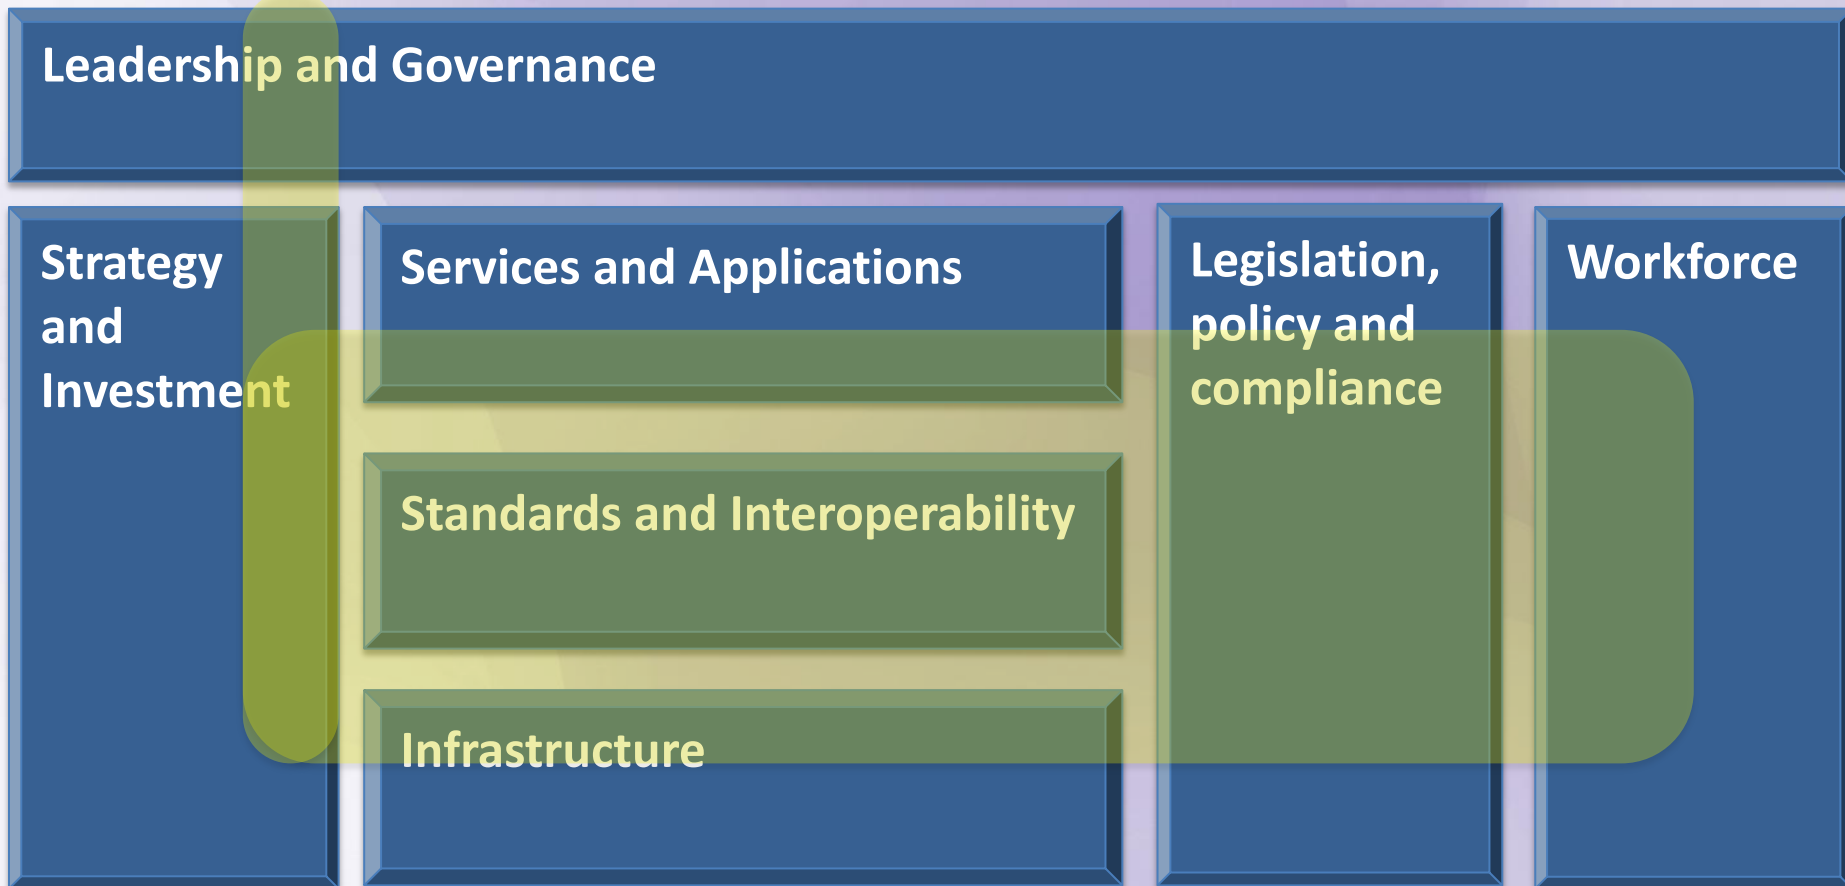

Forum e-Zdrowia / eHealth Forum  
Gdansk - September 15-16 2016

Charles Parisot

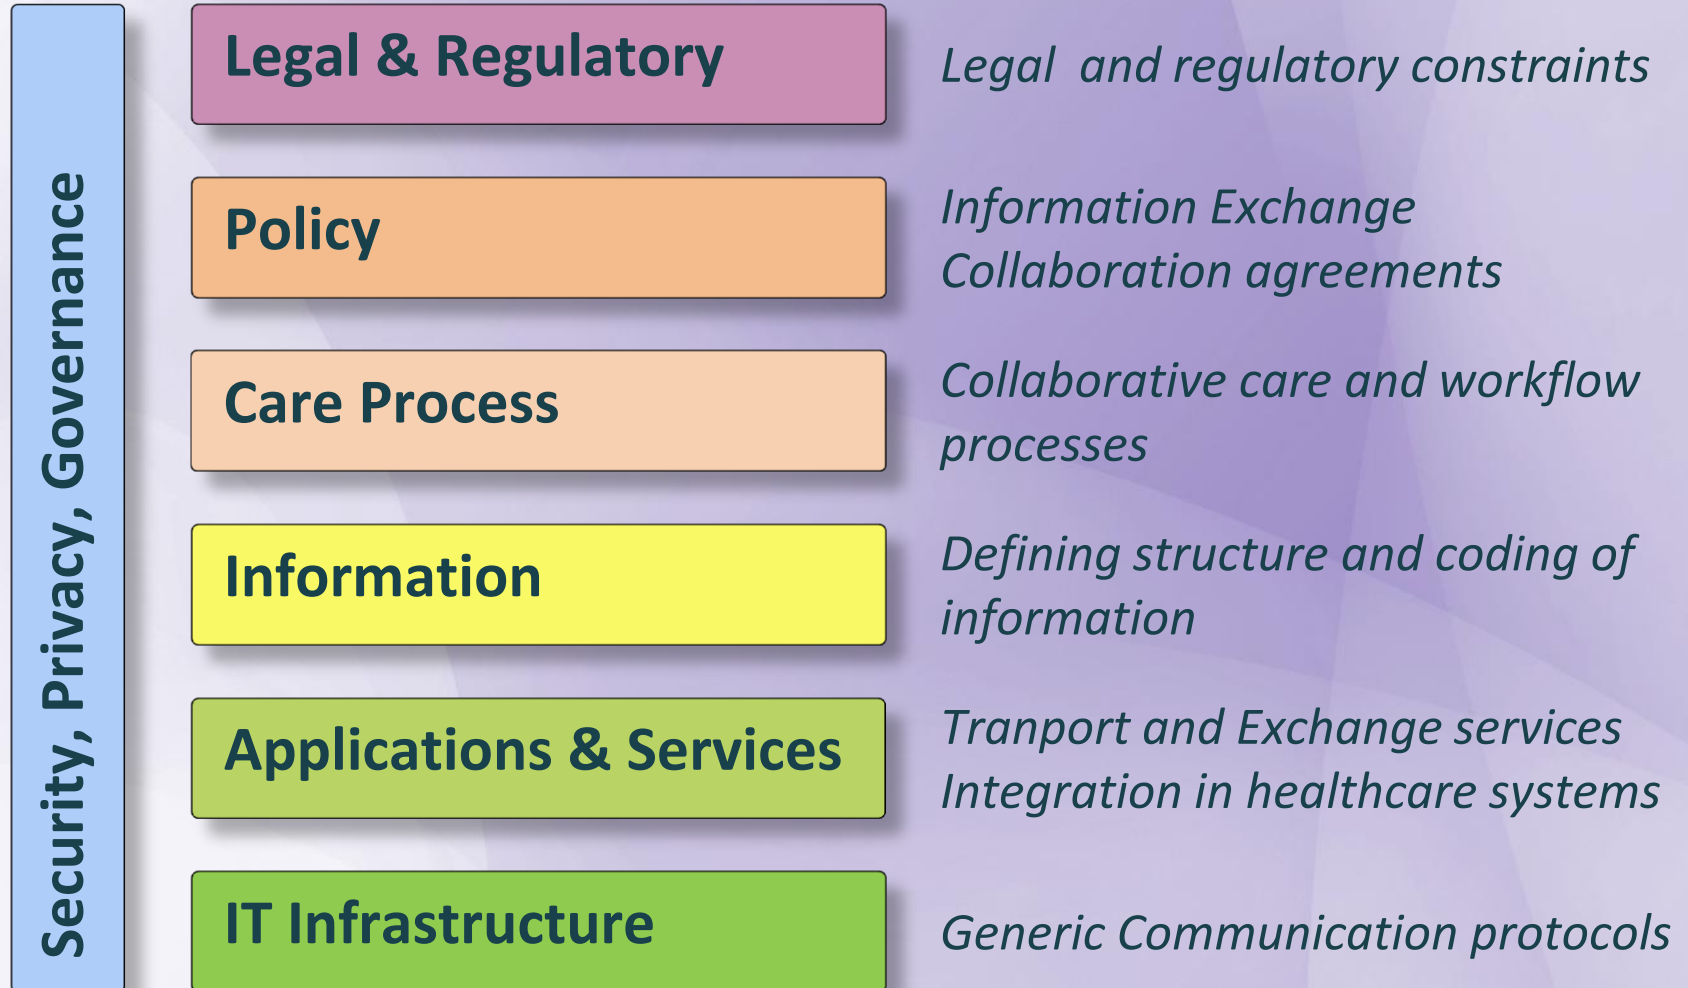

IHE International Board Member, GE Healthcare

# Components of a National ehealth Strategy

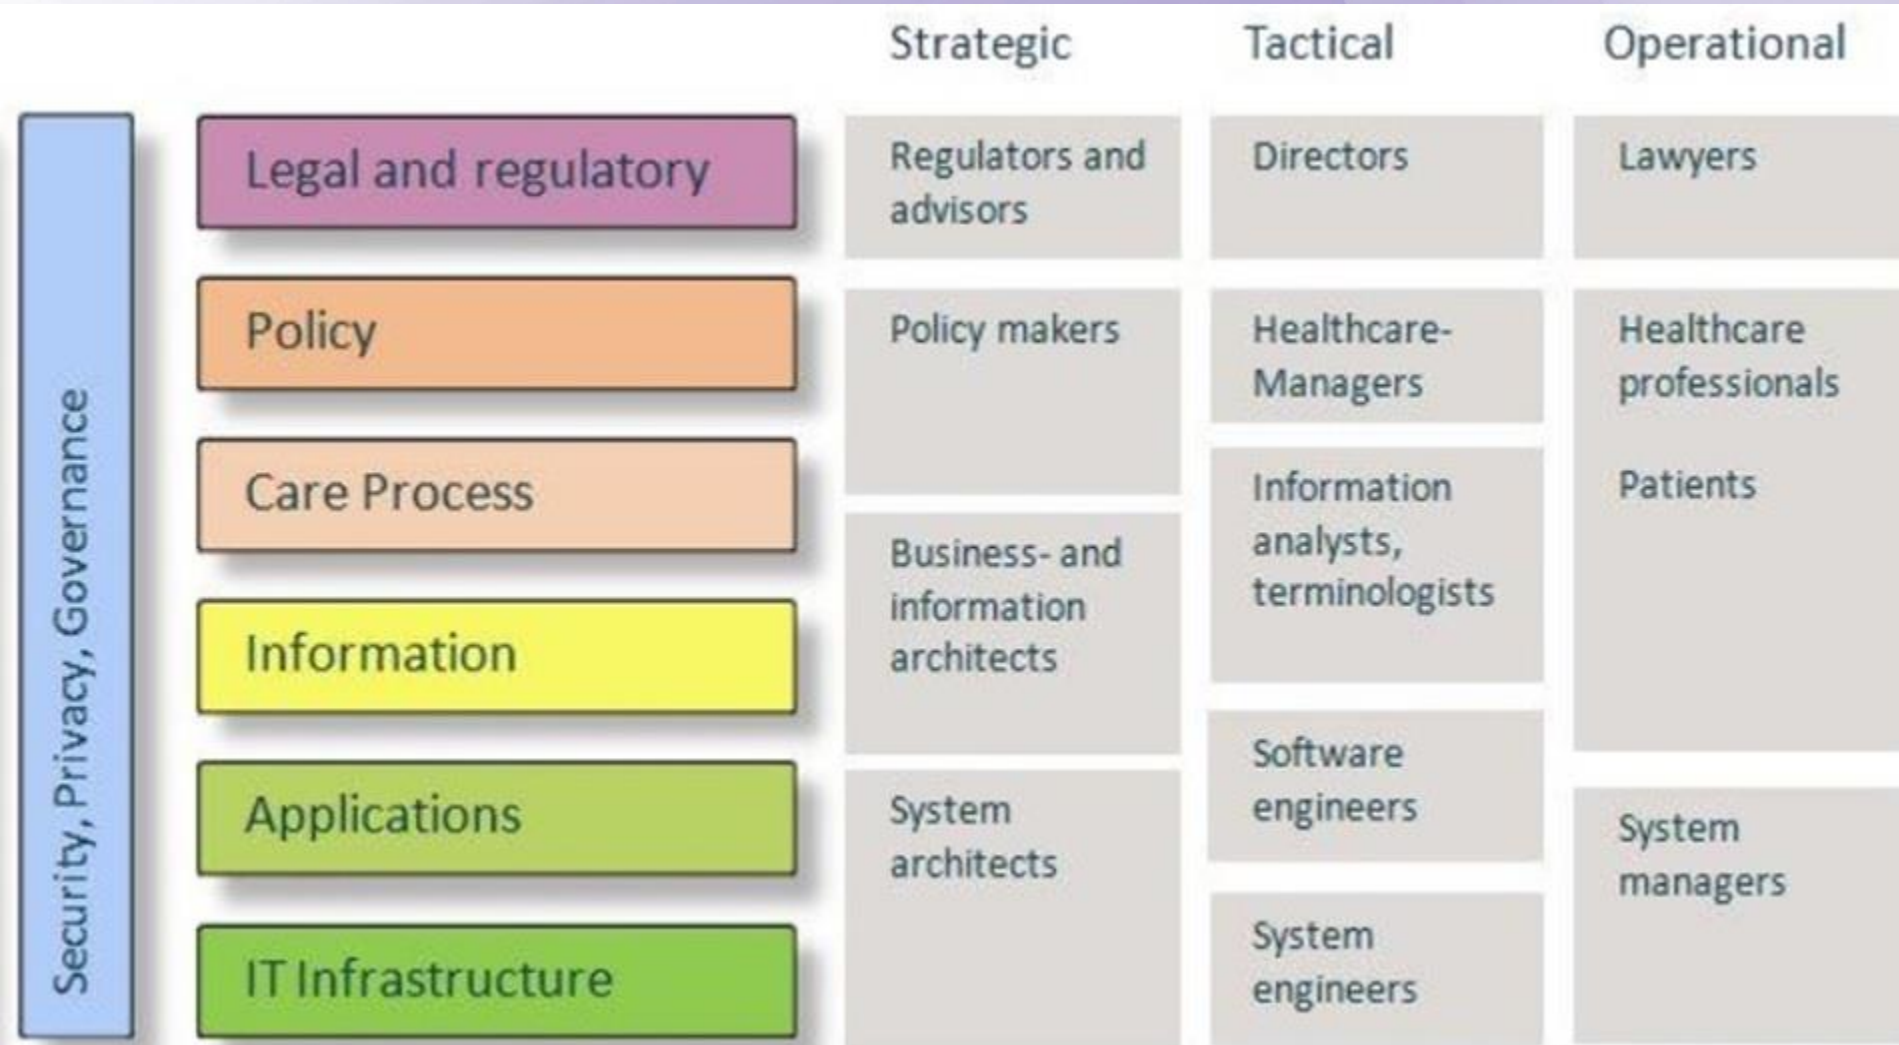

What components contribute to **interoperability** ?

# The many dimensions of Interoperability

# Interoperability has far reaching impacts among many stakeholders

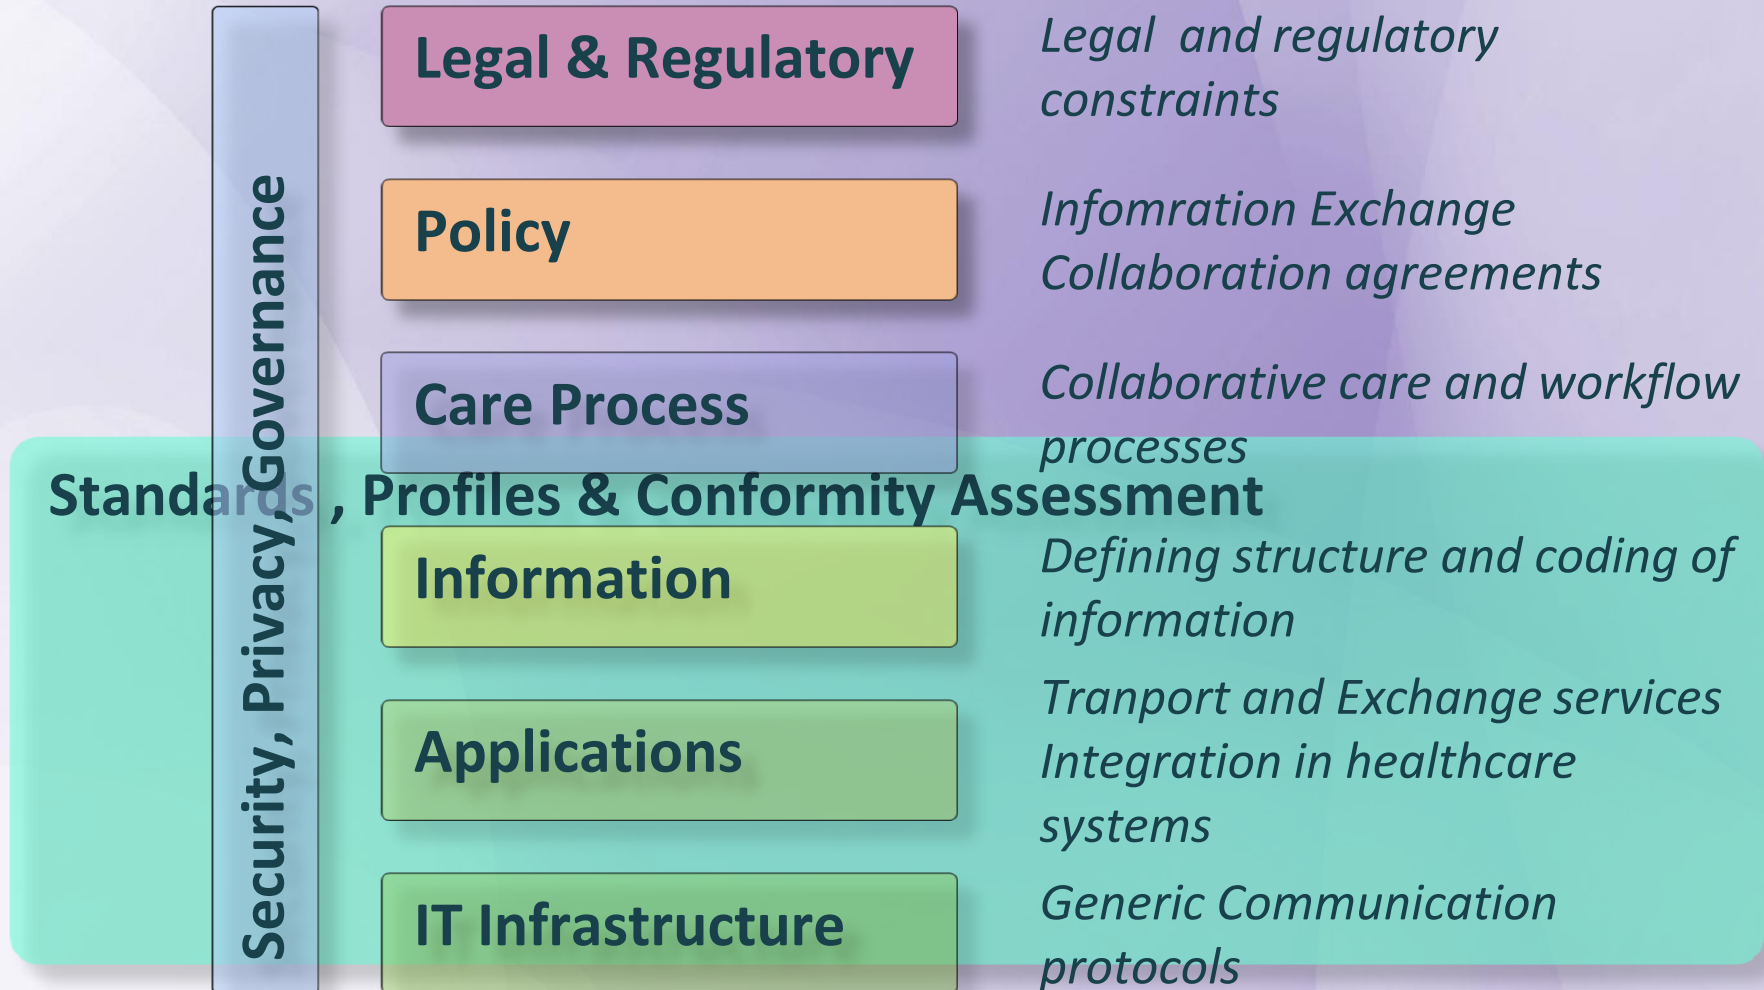

# What leads ehealth programs to not control interoperability ?

- Specification of the technical details of the flow of information between different ehealth systems is very technical, complex, with standards difficult to choose.
  - Correct, but there are ways to simplify
- This is a technical problem, not important for policy setting. The vendors of systems will figure it out working with the IT deployment staff .
  - There are policies implications and....
  - You may likely be blamed

# What reasons ehealth programs give for controlling interoperability ?

- ***Solution choice:*** Enables procurement of the IT systems from different vendors or open source, initially and over time (replacement, future proofing).
- ***Consistent Security and Privacy:*** Policies are simpler to deploy when relying on same interoperability technical measures.
- ***Quality in exchange and information:*** Reduces finger pointing between:
  - care providers and health policy makers
  - systems buyers and vendors
- ***Reduce Costs and Project Risks:*** Building gateways is complex and needs constant investments to implement proprietary/ad-hoc interoperability specifications and maintain competences.

# Primary contribution of interoperability profiles and standards

# Practical Approach to interoperability

- Acknowledge the current Standards that exist (and widely used) and their value
- Don't be afraid to draw a line in the sand and mandate profiles and standards
- Understand the ownership and sustainability of those standards both internally and externally
- Start small with contained use cases to demonstrate the value and build a culture of interoperability

# Gain control of Interoperability (1)

- Reduce complexity to master the detailed flow of information between ehealth systems through selection of Use Cases:
  - ➔ Use Case = Description of an interoperability problem
  - ➔ Select Use Cases based on constraints and strategic goals (e.g. integrated care)
- Simplify choices of Standards using Profiles when available. Otherwise profile them yourself (e.g. terminology value sets).

# Gain control of Interoperability(2)

- Mandate profiles and standards in the context of each use cases:
  - Develop national “interoperability specifications” to record the use cases and corresponding supporting profiles/standards and national extensions, if needed
- Ensure ownership and sustainability to demonstrate value and build culture of interoperability.
  - Establish a “neutral” National Interoperability Center to:
    - Turn each use cases into National Interoperability Specifications based on profiles.
    - Bring innovation as extensions of existing use cases or new use cases
    - offer test tools and organize conformity assessment

Thank-you for listening
